Part 1: Introduction of the practice needs

Initial steps

Before establishing a practice, you have to decide where it is that you want to live. However, deciding on an urban, suburban, or rural area may be somewhat difficult. The first thing that one has to evaluate is the number of plastic surgeons who are practicing within the community. It would be very difficult to establish yourself in an area where there are multiple plastic surgeons who already have appropriate referral sources, and it is best to look for a community in which there is a definite need for a plastic surgeon, either with a group or in solo practice or even in academic medicine.

The location

Before you finish training, you should investigate the area in which you are interested. Look at demographics, population growths, median incomes, growth of the city and/or community, and

Short View Summary

GENERAL CONSIDERATIONS

- People living past 65 years of age are rapidly increasing in number.
- Individuals older than age 65 years have a higher incidence of most infections than do younger people.
- For nearly all infections, clinical manifestations are more subtle in the elderly.

URINARY TRACT INFECTION

- Asymptomatic bacteriuria should not be treated.
- Symptomatic infection is often caused by organisms other than *Escherichia coli*.
- Extended-duration therapy (i.e., >7 days) of symptomatic infection is not needed in either men or women.

Drug Information Provided By Gold Standard

Description: Acetaminophen (APAP, paracetamol) is a para-aminophenol analgesic and the active metabolite of phenacetin. Due to the toxic effects of phenacetin at therapeutic doses and the availability of acetaminophen, phenacetin is no longer used. Acetaminophen possesses analgesic and antipyretic activity similar to aspirin; however, acetaminophen has no peripheral antiinflammatory activity or effects on platelet function. Acetaminophen was first used in clinical medicine in the 1890's. It is effective in the relief of both acute and chronic pain and may be preferred over NSAIDs due to fewer hematologic, GI, and renal effects. Acetaminophen is the preferred analgesic/antipyretic for patients in whom aspirin is contraindicated and in those with underlying renal disease for episodic, though not chronic, use.²³⁹⁷⁷ In addition, acetaminophen has been recommended by the American Lung Association as the first line treatment for aches and pains associated with the flu, by the American Geriatrics Society for both minor and persistent pain in elderly patients³⁵⁸¹⁴, and by the American College of Rheumatology as first-line therapy for osteoarthritis of the hip or knee³⁵⁹⁷⁶. The drug has a history of safe and effective use; however, unintentional or intentional misuse of acetaminophen is the number one cause of acute hepatic failure in the U.S.³²²⁰² Acetaminophen was first approved by the FDA in 1950. Intravenous acetaminophen (Ofirmev) was approved by the FDA in November 2010 for the treatment of pain and fever in adults, adolescents, and children over the age of 2 years.⁴²²⁸⁹

Mechanism of Action: The exact mechanism of action is unknown, but acetaminophen is thought to mediate its actions centrally through activation of the descending serotonergic pathways. Acetaminophen is believed to increase the pain threshold by inhibiting prostaglandin (PG) synthesis through the cyclooxygenase (COX) pathway, similar to nonsteroidal anti-inflammatory drugs (NSAIDs). Though

Disease Overview > View Full Topic
Ferri's Clinical Advisor 2016 · Ferri, Fred F., M.D., F.A.C.P.

Definition

Migraine headaches are recurrent headaches that are either preceded by a focal neurologic symptom (migraine with aura), occur independently without preceding focal neurologic symptoms (migraine without aura), or have atypical presentations (migraine variants). The migraine aura typically is characterized by visual or sensory symptoms that develop over 5 to 60 min. If aura includes motor weakness, the migraine is referred to as hemiplegic. In migraine with and without aura, the headache is typically unilateral, pulsatile, and associated with nausea and vomiting, photophobia, and phonophobia. Migraines that occur ≥ 15 days every month for ≥ 3 months are known as chronic; otherwise, they are referred to as episodic.

In asthma, normal airflow in airways (bronchi) is blocked. It most often starts in childhood. Children have small airways, so their asthma is especially serious.

Asthma attacks may be caused by pollen, dust, dander, smoke, cold weather, flu, and stress.

Symptoms include wheezing, coughing, chest tightness, and

Asthma in Children

Disease Overview [View Full Topic](#)

Conn's Current Therapy 2016 · Bope, Edward T., MD; Kellerman, Rick...

Epidemiology

Asthma prevalence in the United States has been on the rise since the 1990s. It is currently estimated that 9.6% of children younger than 18 years (7.1 million children) carry the diagnosis of asthma. Male sex, African American or Puerto Rican ethnicity, and lower socioeconomic status are associated with an increased risk of developing asthma. Prevalence estimates for these groups are as high as 11% to 16%.

Asthma has a significant impact on both school attendance and health care expenditures. According to the National Health Statistic Report in 2007, children made 640,000 emergency department visits and were hospitalized 157,000 times as a result of asthma. In 2008 it was estimated that there were 10.5 million missed school days, and about 5% of children reported long-term limitations on their usual activities due to asthma symptoms.

◆ **Definition**

Pancreatic cancer usually refers to ductal adenocarcinomas of the pancreas, because more than 90% of pancreatic tumors arise from the ductal epithelium. Other major tumors of the pancreas include endocrine malignancies (Chapter 195), carcinoid tumors (Chapter 232), lymphomas (Chapter 185), and a variety of rare sarcomas.

◆ **Epidemiology**

Pancreatic ductal adenocarcinoma (PDAC) has one of the highest incidence-to-mortality ratios of any disease. Although it represents the tenth leading cause of cancer in the United States, it is the fourth leading cause of cancer-related deaths, ¹ because the vast majority of patients will die from their disease. Annually, approximately 40,000 individuals will die in the United States from PDAC or its complications. The
